

# PACEO

French design & manufacturing

---

Combining elegance and simplicity, Pacey offers a variety of experiences and connections.

PACEO collection

# PACEO

## TOP

The light has an adequate positioning and centered on the essential

The luminaire head position creates a fluid and rational beam.

In urban, residential and landscaped living spaces, Pacey takes up the challenge of balance and timelessness.

Pacey Top is fixed directly at the top of the mast or worn on a bracket arm.

# PACEO

## LIVING SPACES

Paceo Duo can be mounted on top at the head of the mast or side on a bracket arm.

Paceo Duo

---

Paceo draws an overhead line thanks to a design in height.

Paceo Air, adorned with an arm, admits a worn fixation.

---

Paceo Air

# PACEO

## AERIAL LINE

Paceo Sky

Paceo Sky is suspended under a bracket arm or catenary thanks to its upper fixation.

The clear lines suggest the perfect tuning  
in the direct top position.

# PACEO

## DECO

The Paceo luminaire features a customizable decorative cut-out to bring graphics and visual identity to the lighting set. The cutting of the pattern is a design of its own that allows light to be rationally diffused.

Paceo Top Deco

# PACEO

## ARCHITECTURE & STYLE

Paceo inspires the creation of luminous points with an assertive style. As part of architectural development, the silhouette reveals clean lines and brings a touch of modernity.

# RESPECTING BIODIVERSITY

**Black infrastructure** refers to the darkened area of the night sky where artificial light is nuanced to preserve biodiversity.

By creating a two-tone **amber and white** light design in a single luminaire, ABEL has revealed the value of harmonizing light with its environment.

The concept of **Paceo Black infrastructure** is to favour contrast and colour transition. In the absence of human traffic, the amber lighting of the place contributes to the respect of nature and the well-being of the species living there.

**Adjust the colour temperature to perfectly adapt the light to your requirements and create the desired environment.**

When lighting is not required to ensure floor performance and visual comfort, the white LED light offers a range of tones obtained by changing the colour temperature.

The warm and amber versions are the possible alternatives to nuance the lighting and allow eco-responsible light cycles.

**Black infrastructure** = area of darkness, partial or temporary

3000K

Amber

# CONTROLLING LIGHT

To create light ambiances nuanced according to the needs of users, the colour temperature of the LEDs adapts during the night. Light-dark cycles preserve biodiversity.

## COLOUR TEMPERATURE VARIATION

### Tunable white

Variation between 3000K/2700K/2200K/Amber according to time (no PIR sensor)

### Black infrastructure

Amber permanently

Addition of blank at detection

DAI & MID PIR sensor mandatory

**Tunable White** = colour variation on programming

PIR sensor integrated to the luminaire

# INTER-LUMINAIRE COMMUNICATION

Connecting the luminous points makes it possible to define lighting scenarios: signal from one luminaire to another on presence detection, decrease of the level of lighting in standby mode, remote power and shade programming, groups of luminaires, etc.

## POSSIBLE FUNCTIONS:

- GPS
- Energy savings
- Dynamic lighting like Luminous path
- Group management
- Service Reports

## The + ABEL :

Compatible with DALI, DALI2 or D4i devices, RGBW drivers or Tunable white  
Dry contact or D4i PIR sensors

Up to 6 DALI devices (drivers, DALI inputs, DALI outputs,...)

Communication nodes and PIR motion sensors can be easily connected, and whenever desired, to luminaires equipped with Zhaga connectors. Gateways, cloud servers, applications or monitoring software complete this network to control lighting.
